

Incremental Attribution

Drive more incremental
outcomes in real time

Incremental conversions are conversions that were a direct result of your ads, as opposed to conversions that may have happened whether an ad was seen or not

————— Credited in Standard Attribution —————

PEDRO

CORRELATIONAL

Saw the ad and purchased, but would have bought it anyway.

- Saw the ad
- Purchased

Increasing incrementality drives stronger returns on marketing investments

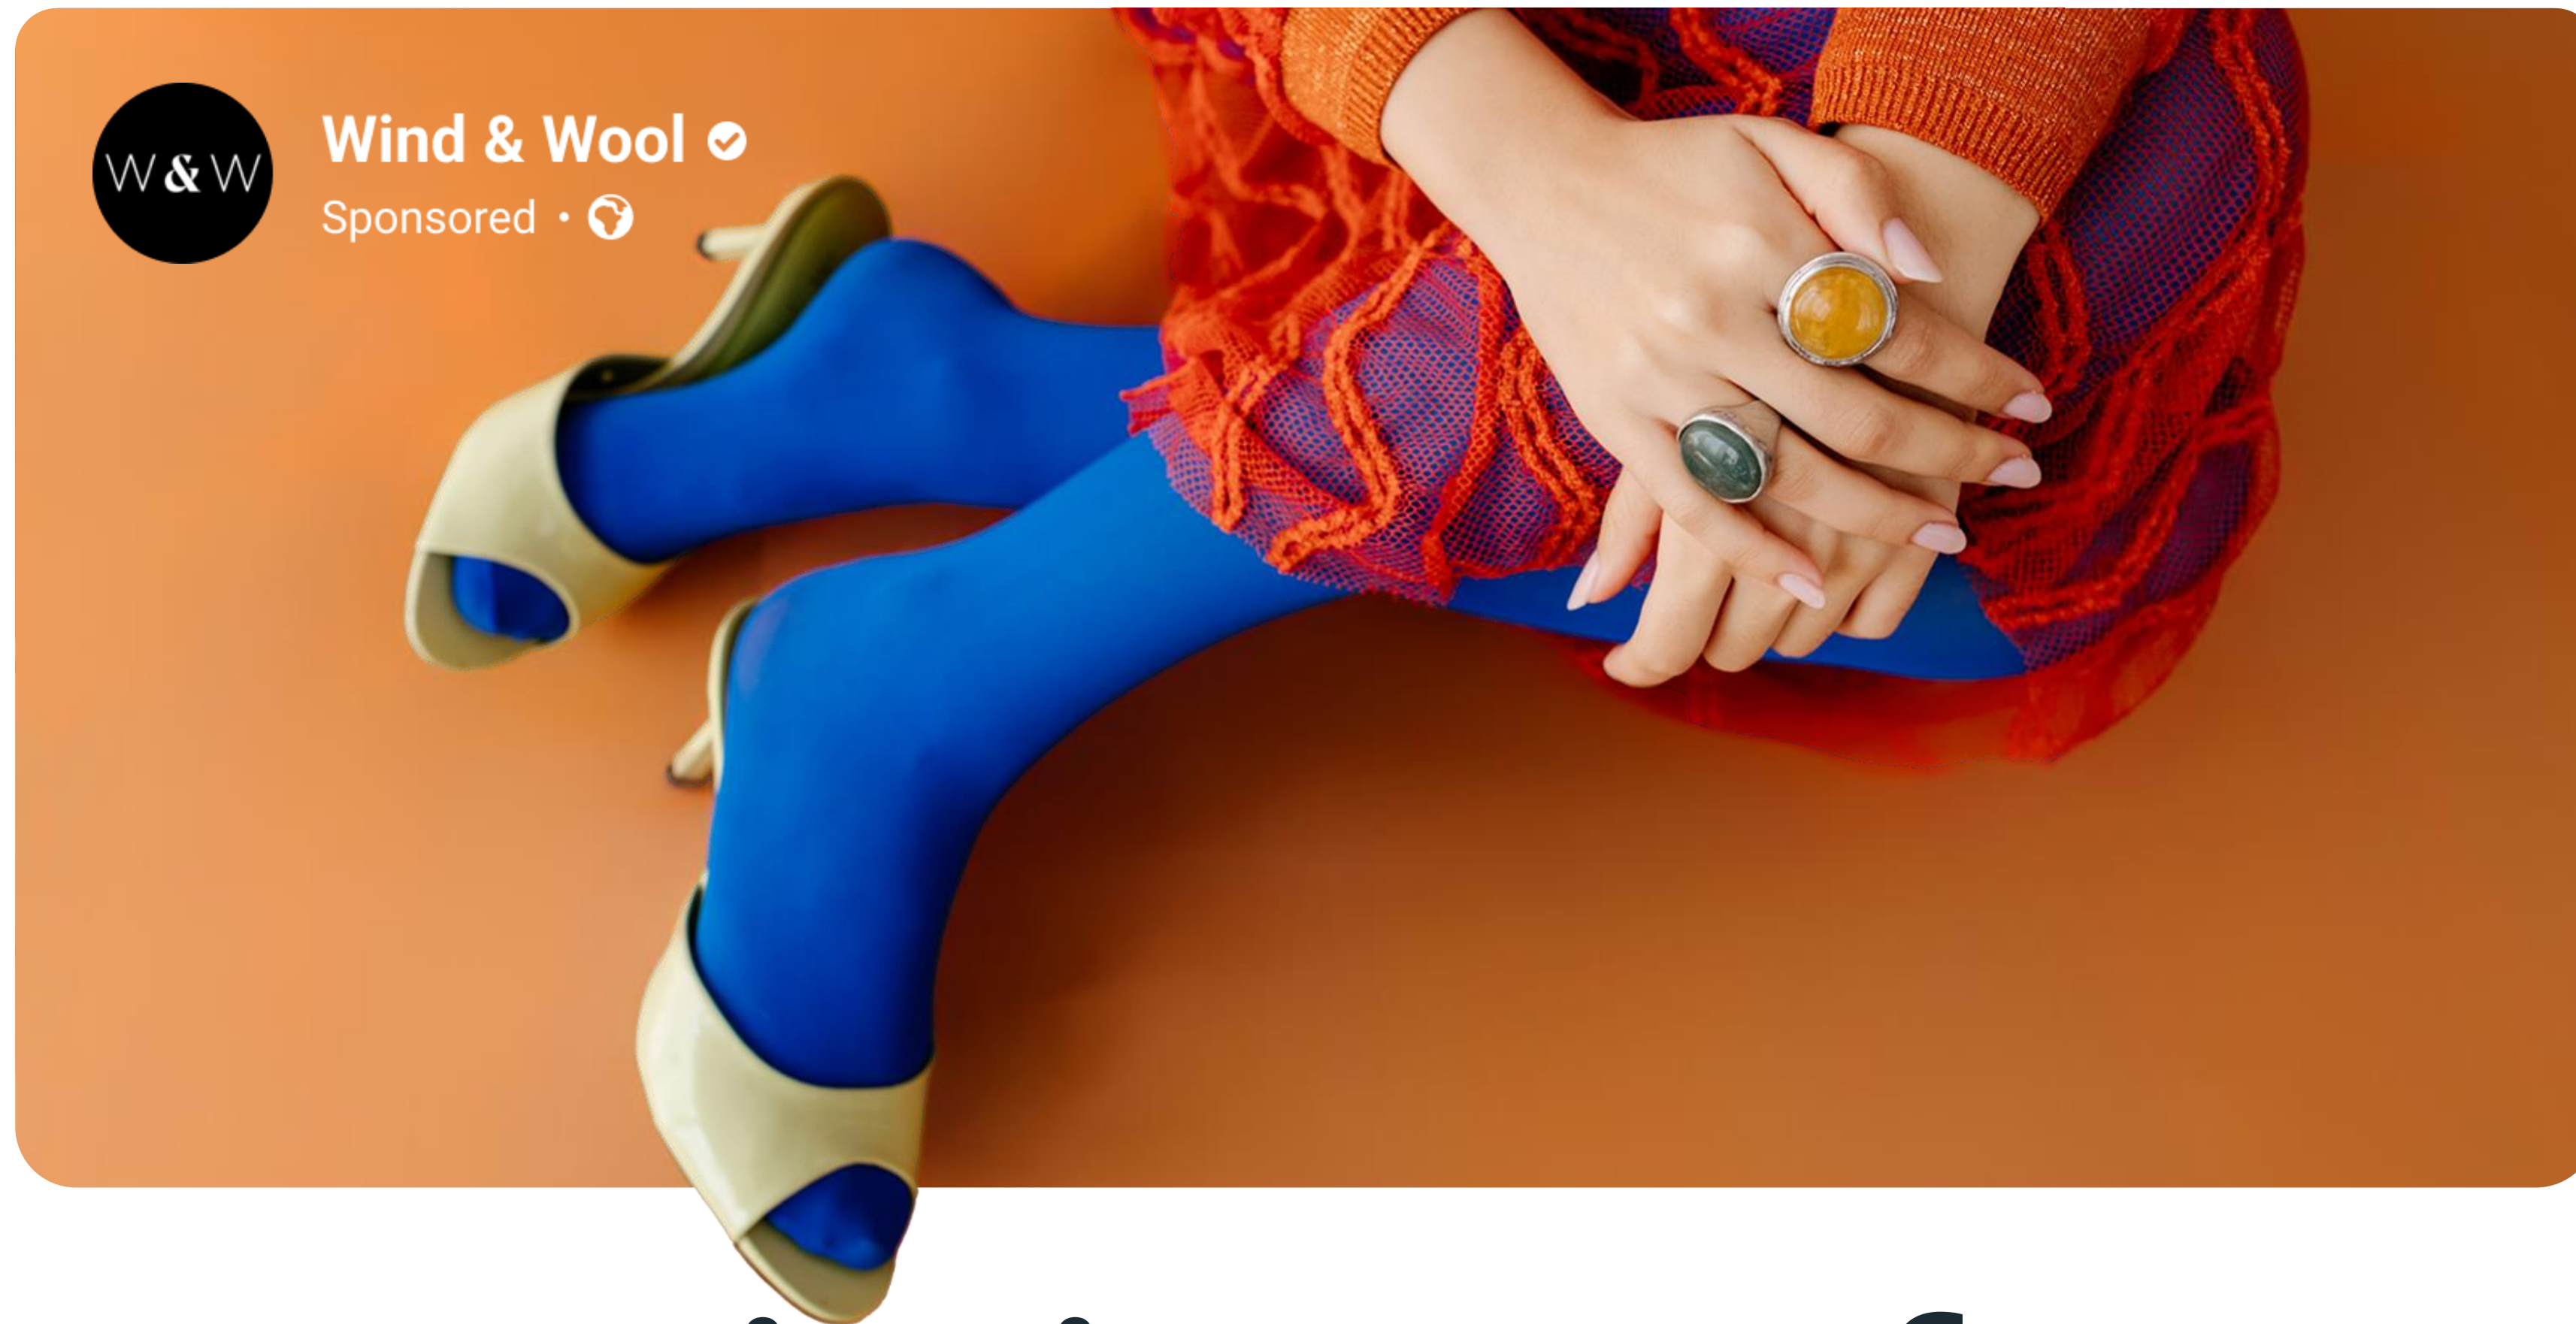

Shifting channel budgets to incremental opportunities instead of last click can lead to a more efficient media mix.

Small percentage changes can mean large increases in revenue, even at the same total budget.

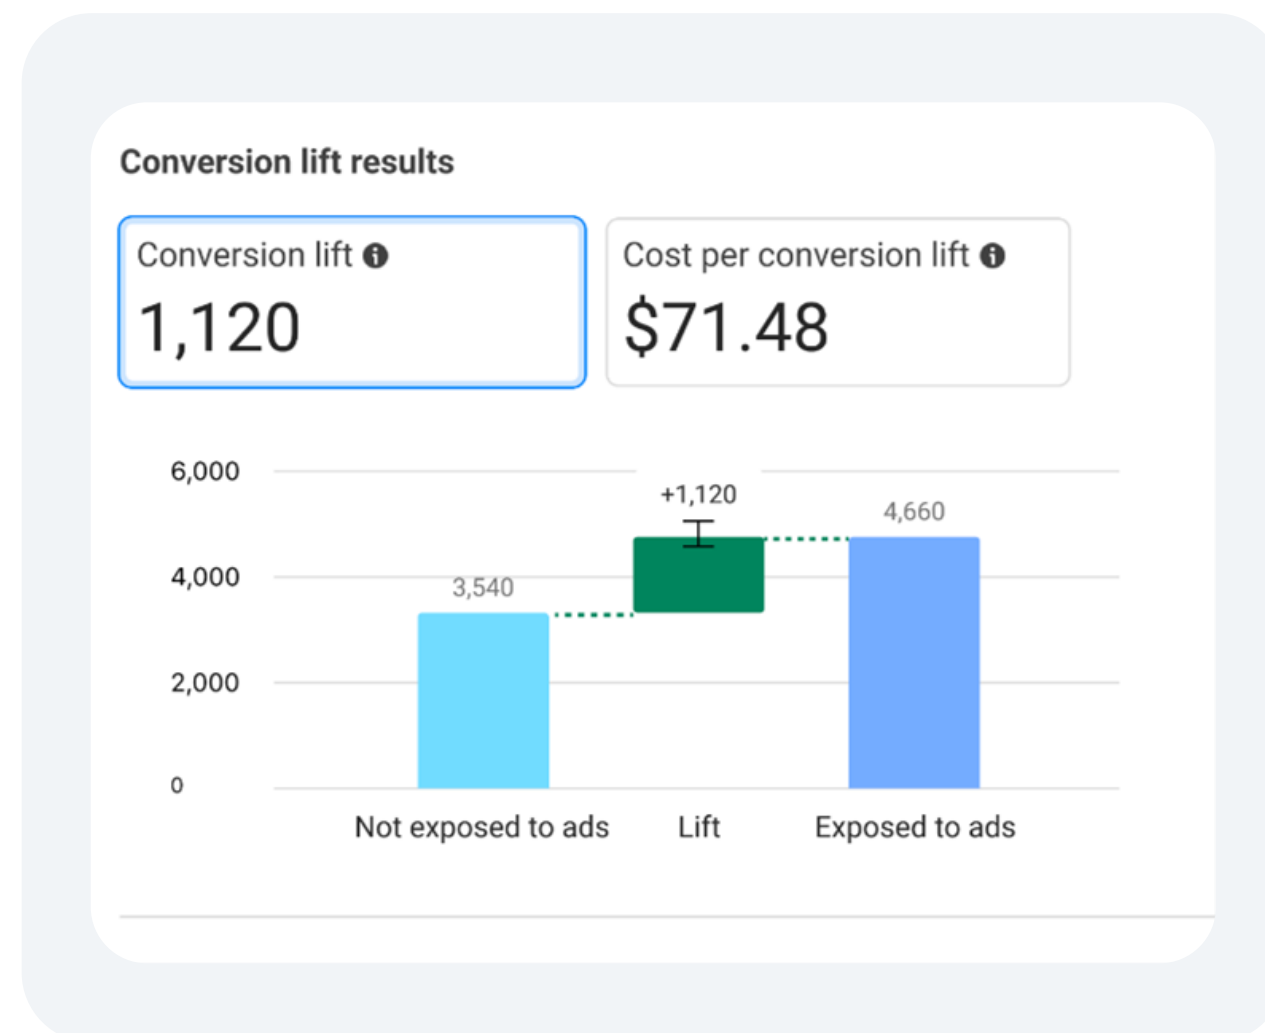

Source: Transunion 2024 meta-analyses of major US omni-channel retailers with a median annual marketing budget of \$400M. YouTube data not available. Results and scalability for individual advertisers will vary depending on business characteristics and investment levels in each channel.

Guide AI to

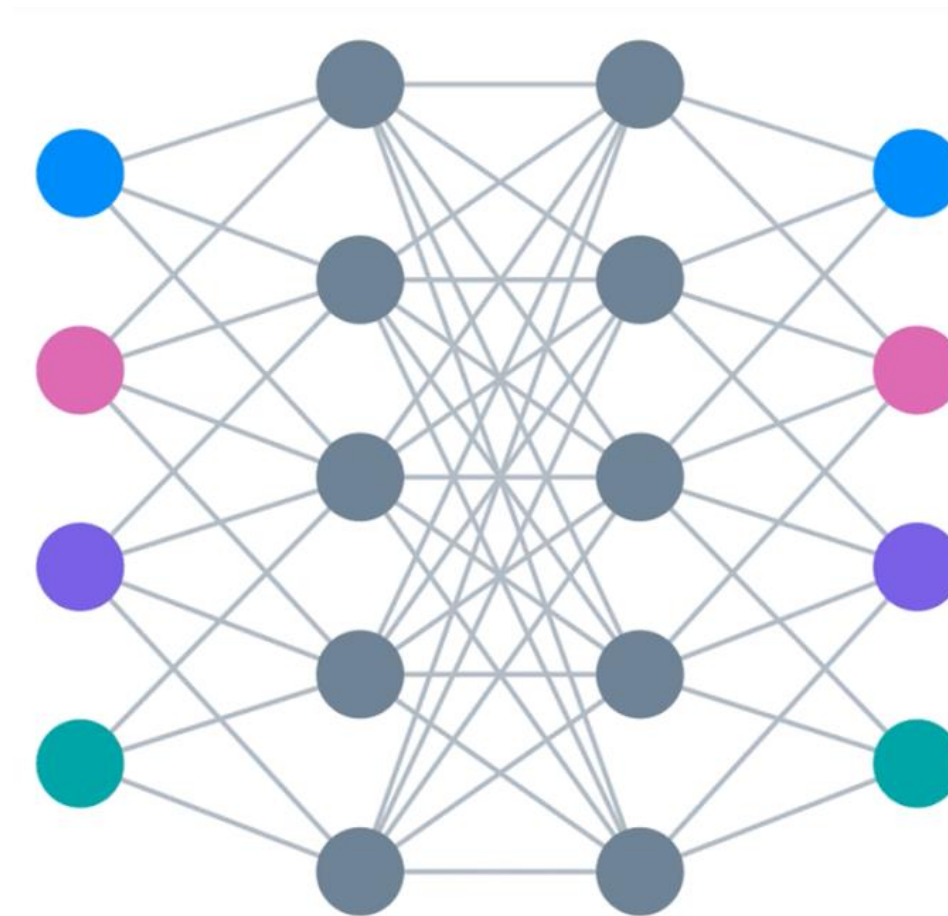

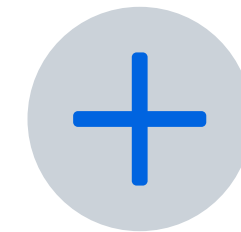

maximize performance

For the first time, advances in AI make real time incrementality possible

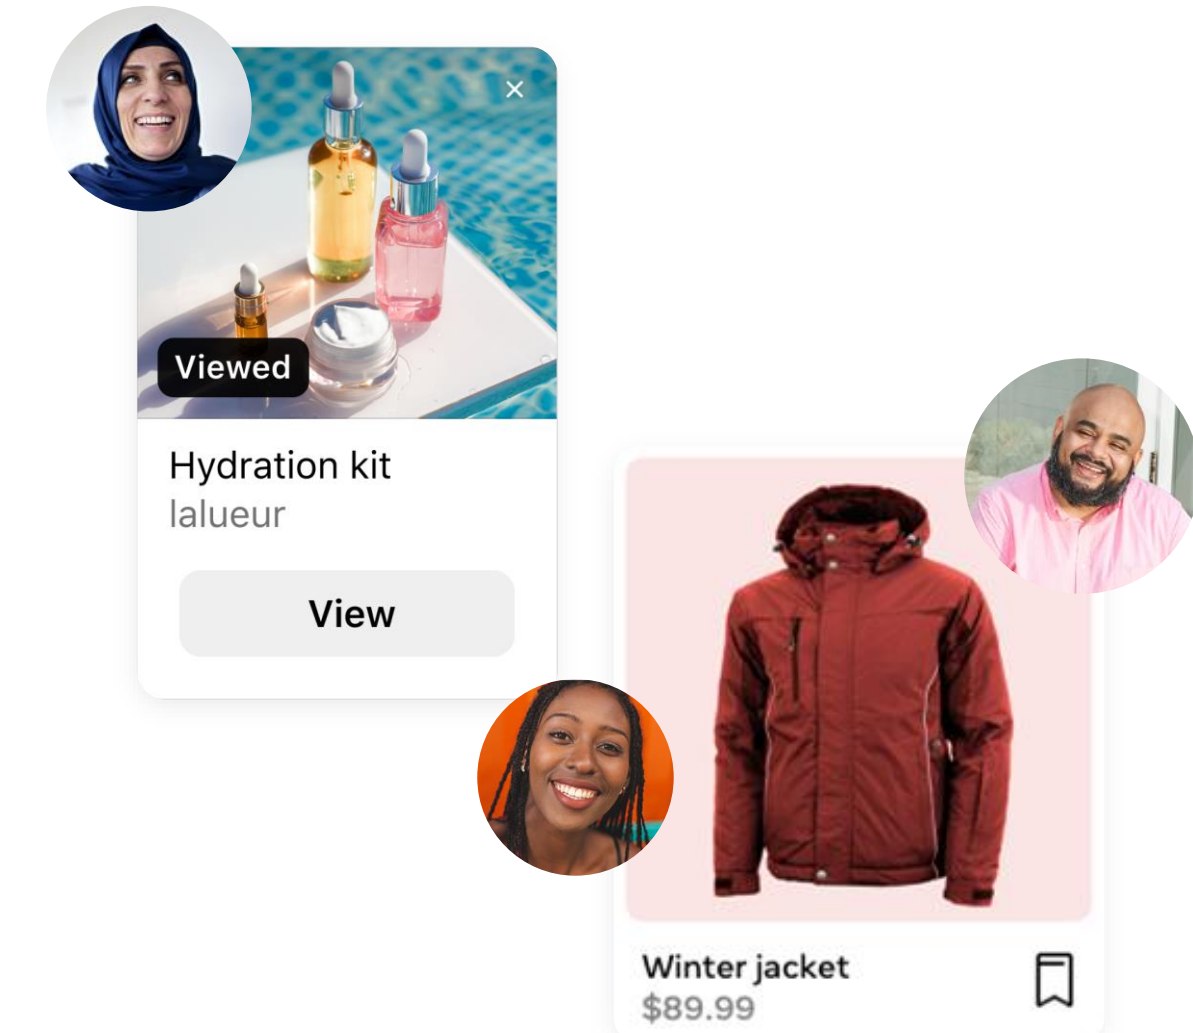

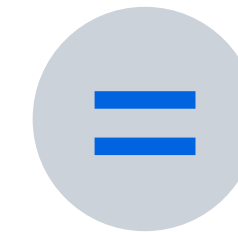

Conversion Lift

Since 2015, this experimentation tool has helped advertisers **accurately measure incrementality.**

AI

Conversion Lift data is used to train machine learning models to **predict and optimize for incremental conversions.**

Incremental Attribution

Now advertisers can **generate more incremental outcomes in real time.**

Incremental attribution is proven to drive more incremental conversions

A man with dark hair, wearing a blue short-sleeved button-down shirt and a blue lanyard, is looking intently at a purple smartphone he is holding with both hands. He is in a shoe store, with several pairs of shoes on display in the foreground and background. A wooden shelf with various items is visible behind him.

+46%

Advertisers saw an average 46% lift in performance when their campaigns optimized for incremental conversions.

Results based on 37 conversion lift studies (where statistically significant incrementality was detected in at least one cell) run between July 2024 and October 2024. This set of studies compared campaign performance for 30 advertisers across 8 verticals in North America, EMEA and APAC. These campaigns mainly target offsite conversion optimizations. This is provided to give you an idea of possible performance, but performance isn't guaranteed.

HelloFresh increases subscriptions with incremental attribution

HelloFresh conducted a test in one of its international markets to assess the performance of incremental attribution, a setting in Meta Ads Manager that optimizes for and reports on incremental conversions in real-time. Using Conversion Lift, HelloFresh found that campaigns optimized with incremental attribution outperformed those using click-based attribution models.

40%

increase in the number of
incremental subscriptions
vs. campaigns optimized
with click-based models

“Incremental attribution increased the efficiency of our Meta acquisition campaigns. It helped us optimize towards activities driving new customer growth, rather than those capturing existing demand. Additionally, the queries run through Advanced Analytics allowed us to gain crucial insights that led to high confidence in our ongoing evaluation for a broader adoption following the first test phase.”

Erica Ghisoni
Director of Paid Social
HelloFresh

Zalando improved incremental return on ad spend by running a Meta Advantage+ sales campaign plus incremental attribution

The fashion and lifestyle ecommerce company saw a 2.4X incremental return on ad spend in Poland when running a Meta Advantage+ sales campaign plus incremental attribution, compared to its usual click-based attribution settings.

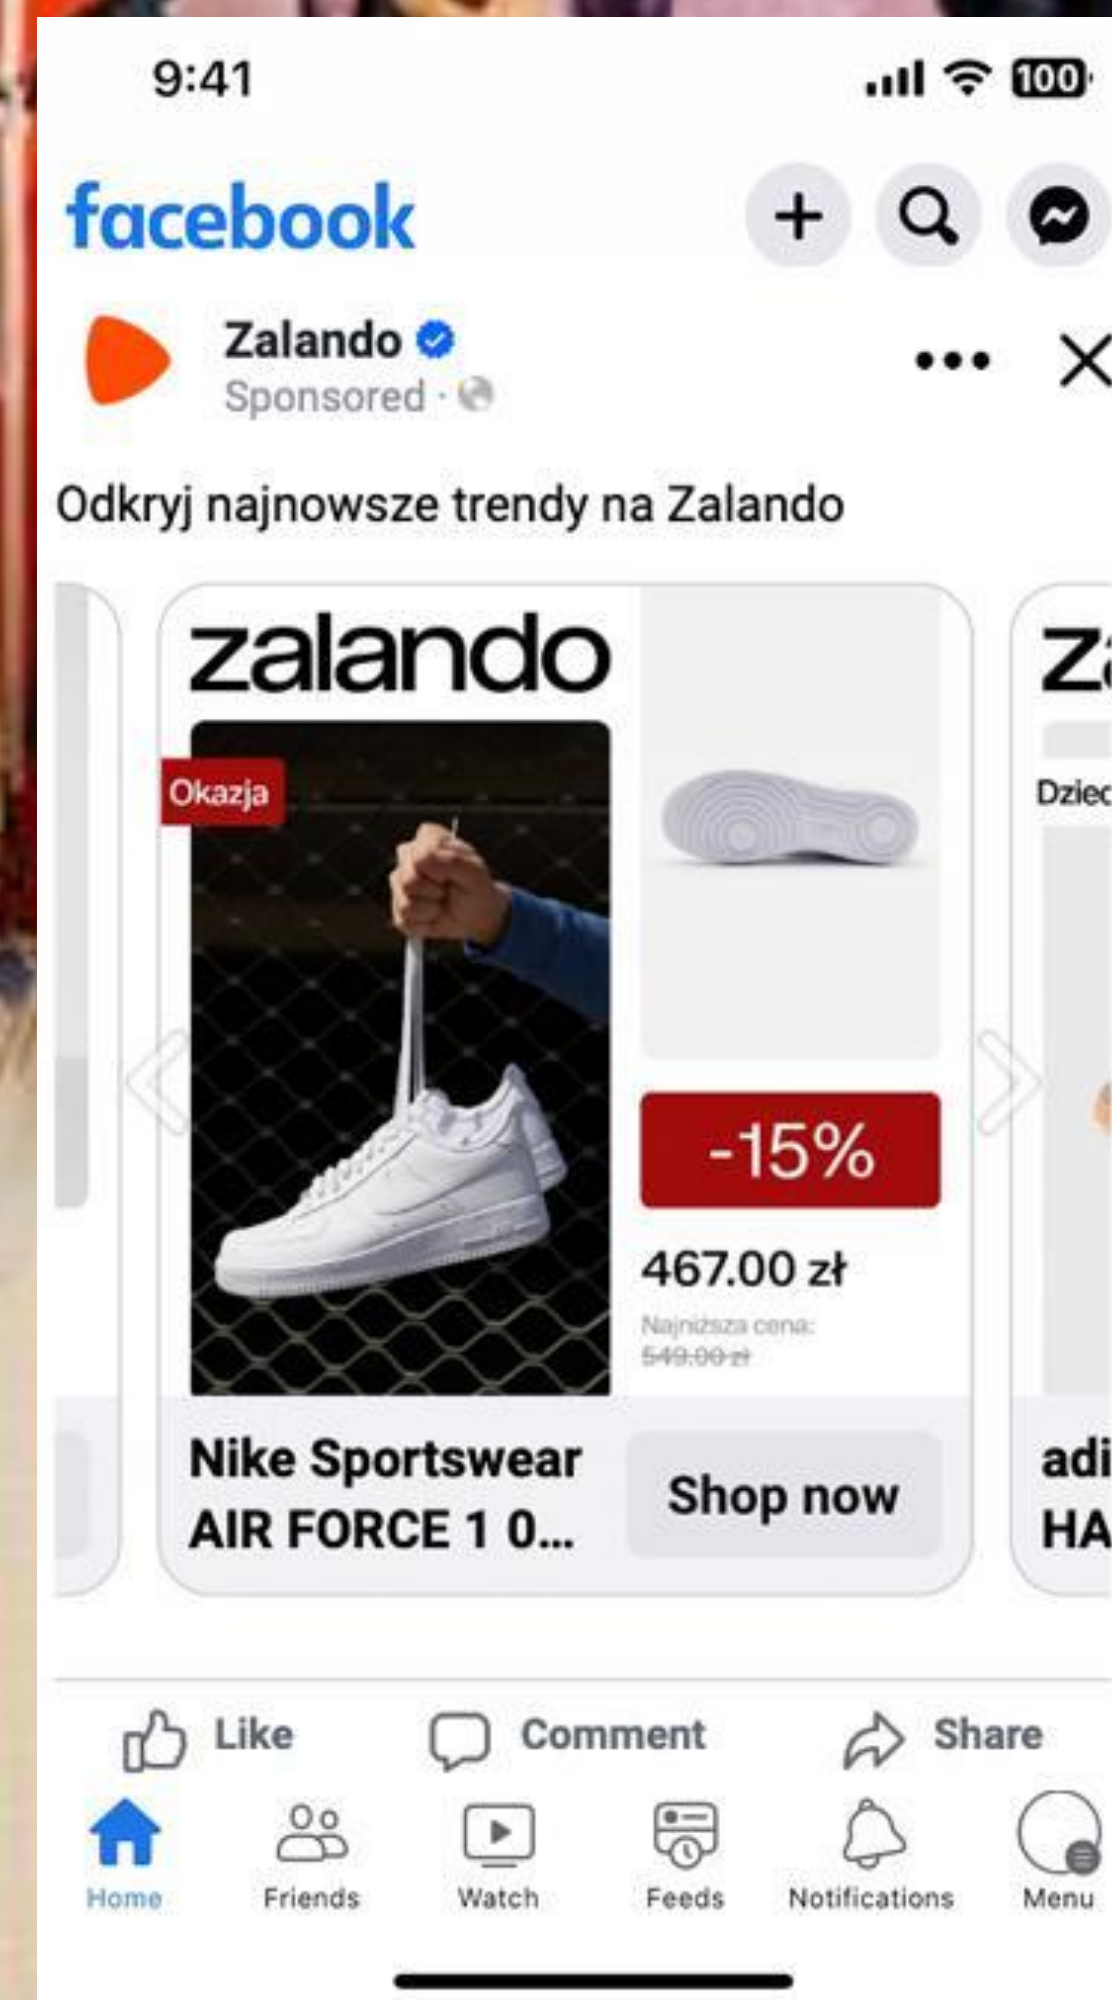

2.4X

incremental return on ad spend in Poland when running a Meta Advantage+ sales campaign plus incremental attribution, compared to its usual click-based attribution settings

48%

lower cost per incremental purchase in Poland when running a Meta Advantage+ sales campaign plus incremental attribution, compared to its usual click-based attribution settings

Source: <https://www.facebook.com/business/success/2-zalando>

“Zalando has always pushed boundaries in understanding customer behavior and marketing effectiveness. Pioneering incremental attribution with Meta has taken this further by optimising specifically for conversions that wouldn't happen without our ads. This approach represents a significant advancement in how we'll continue investing in marketing to drive sustainable growth in Europe.”

Katija Vlatkovich
Head of Performance Marketing
Zalando

Achieving more incremental sales with incremental attribution

Boots, the leading pharmacy chain, sought to improve efficiency by focusing on incremental sales. They used incremental attribution paired with Advantage+ sales campaigns to guide our ads system to deliver the results they valued most.

15x

increase in incremental sales lift compared to business as usual

15x

increase in incremental ROAS compared to business as usual

21%

additional reach for the same investment compared to business as usual

All results are self-reported and not identically repeatable. Generally expected individual results will differ.
Source: Meta for Business case study, February 2025

“It’s great to see Meta developing solutions that so closely align with our specific business needs.”

Ollie Shayer
Omni-Media Director
Boots UK

Boosting outcomes with incremental attribution

Laura Geller, part of the AS Beauty portfolio, wanted to optimize its ads for beauty products toward incremental users on Meta. They used incremental attribution paired with a multi-cell Conversion Lift test to understand the effectiveness of the product. It saw:

71%

lower incremental CPA in the top performing incremental attribution cell vs. business as usual

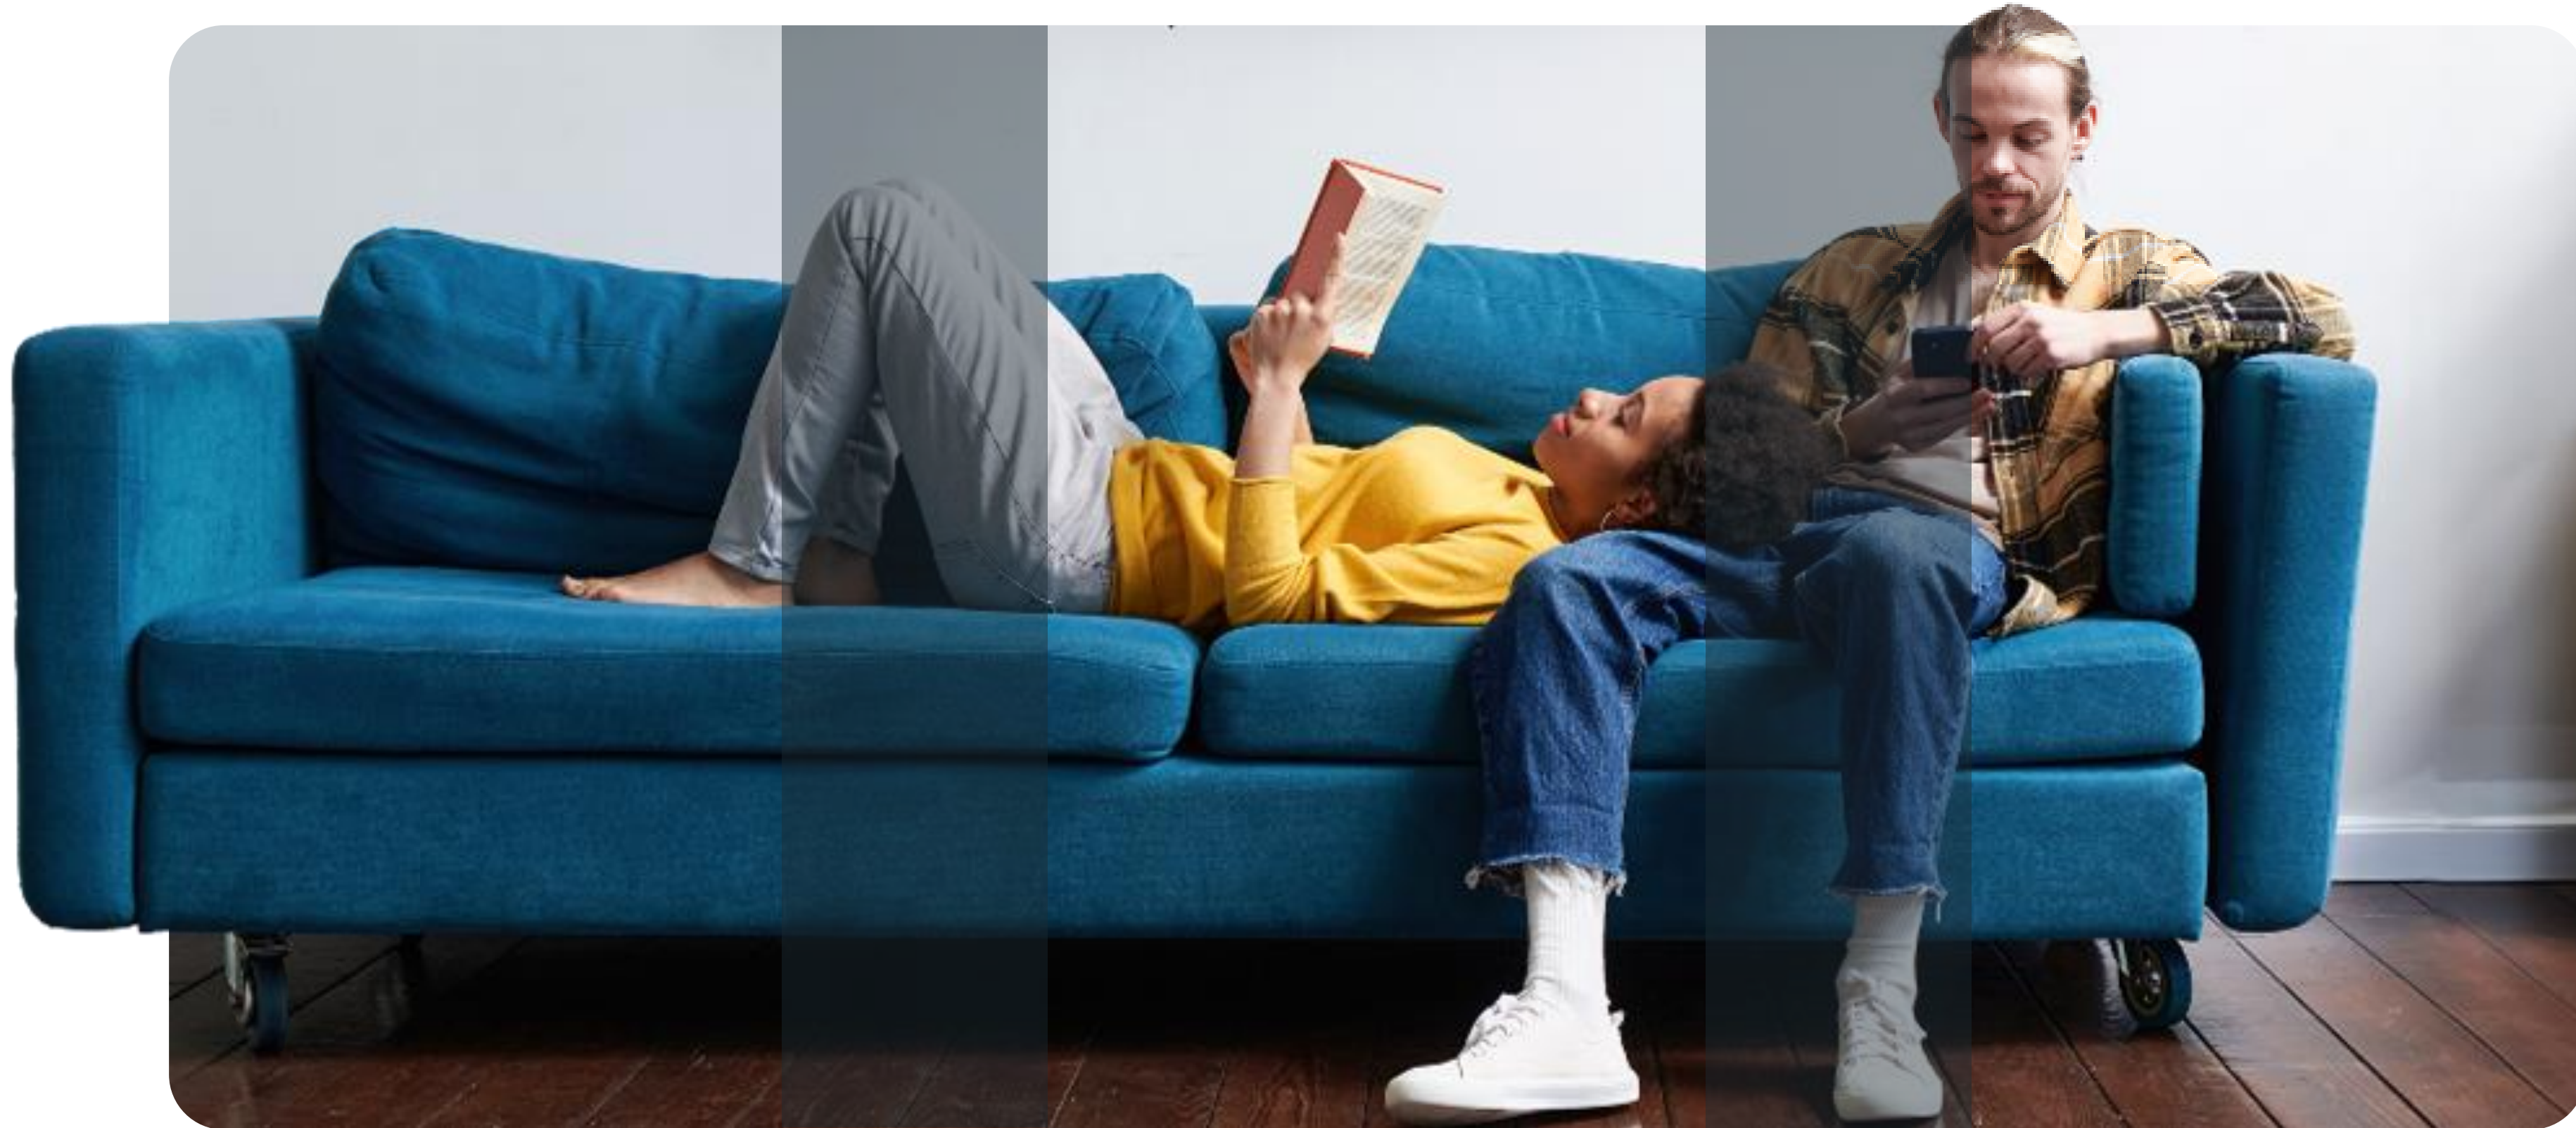

229%

higher incremental ROAS in the top performing incremental attribution cell vs. business as usual

“We’ve since scaled nearly all of our campaigns to use incremental attribution as the primary optimization lever.”

Scott Kramer
VP, Growth Marketing
AS Beauty

Slides 16-17

AI models trained on Lift data perform much better than models trained on other sources

7 – 244x

Researchers at Northwestern University and Meta built AI models that predicted the incremental performance of new campaigns based on learnings from a large set of prior Lift studies and found these models performed 7-244x better than models trained on non-incremental data, depending on the type of model being used.

6 – 13%

This research also shows that AI models trained with Lift data on average help determine if ad campaigns have positive ROI at least 87% of the time (more for mid and upper-funnel objectives).

Eco Bio Boutique scales for peak season with Incremental Attribution

Eco Bio Boutique wanted to understand incrementality for campaigns verticalized for a single product: The brand runs 1-2 campaigns per product at a time from its 100-product catalog to control investment. Eco Bio Boutique ran a Conversion Lift study to compare single product campaigns leveraging Incremental Attribution, a setting in Ads Manager that enables optimization and reporting based on incremental conversions.

194%

Incremental
Attribution

“Incremental Attribution from Meta has allowed us to efficiently scale our verticalized single product campaigns. Furthermore, it has given us the ability to quantify the true incremental impact of our strategies, offering a competitive advantage as we make investments. Capturing the real impact of our investments is key to achieving the results we want, especially in today’s complex digital landscape.”

Simone Spizzichino & Giacomo Imperiolini

Eco Bio Boutique

BARK measures impact of optimizing for incremental conversions

Pom Pom London needed a way to capture incremental new customer sales on Meta. The company partnered with agency BARK.London to test Incremental Attribution, a new attribution setting in Meta Ads Manager. BARK helped capture the value of this new attribution setting with a multi-cell Conversion Lift study, then cross-validated the results using Robyn, an open source marketing mix modeling (MMM) package from Meta.

57%

higher ROAS for campaigns using Incremental Attribution as an optimization lever

94%

higher marginal ROAS for campaigns using Incremental Attribution vs. those that weren't

“BARK is always innovating with paid media, looking to understand what really works in this fast changing landscape. Their data-driven approach, using Robyn to measure the impact of Meta’s new ‘Incremental Attribution’, revealed powerful insights about our campaign performance and uncovered new revenue opportunities across channels. They've transformed how we measure and optimize our marketing investments.”

Harry Griffiths
Co-Founder
Pom Pom London
